

I have really enjoyed WEBD-225. The course has helped me expand upon my previous knowledge of HTML and CSS languages to comfortably make web pages from scratch. The introduction of JavaScript into my programming has helped me bring previously 'flat' webpages to life, adding exciting layers and dimensions to my capabilities. I don't know if I'm going to take this knowledge into a professional setting, but I plan on doing web development as a hobby, and I'm going to continue expanding on the website I made in Git in the future and possibly purchase a unique domain name for it.

Optimization wise, my pages received very good Lighthouse performance scores. I think that right now they're very simple and accessible, so there wasn't much to worry about performance. The report did suggest adding meta data on each page to improve SEO. I added a content description for each page, such as band/song title on the radio page, image descriptors on pages with images, and my name as the author. As I add more stuff to my pages, especially more JavaScript, I think it's important to run performance diagnostics to make sure that my pages still load smoothly and remain accessible.
